# USER MANUAL

Ref. no. 0458-395-0181

## **LOGOSOL ES5/ES8** ELECTRIC CHAINSAW

**EN**

# THANK YOU FOR CHOOSING A LOGOSOL MACHINE!

**W**e are very pleased that you have demonstrated your confidence in us by purchasing this saw unit, and we will do our utmost to meet your expectations.

Logosol has been manufacturing sawmills since 1989. In that time we have supplied approximately 50,000 machines to satisfied customers the world over.

We care about your safety as well as we want you to achieve the best possible results with your sawmill. We therefore recommend that you take the time to carefully read this user manual from cover to cover in peace and quiet before you begin using the saw. Remember that the machine itself is just part of the value of the product. Much of the value is also to be found in the expertise we pass on to you in the user manuals. It would be a pity if that were not utilised.

We hope you get a lot of satisfaction from the use of your new machine.

*Bengt-Olov Byström*

**Bengt-Olov Byström**  
Founder and chairman,  
Logosol in Härnösand, Sweden

Read through the user manual carefully and make sure you understand its contents before you use the machine.

This user manual contains important safety instructions.

**WARNING!** Incorrect use can result in serious or fatal injuries to the operator or others.

LOGOSOL continuously develops its products. For this reason, we must reserve the right to modify the configuration and design of our products.

## SAFETY INSTRUCTIONS

- Read the entire manual carefully before the electric chainsaw is put into operation. Failure to comply with safety regulations may result in danger to life.
- Make sure that everyone working with the electric chainsaw is well acquainted with the risks and has read the manual. The manual should always be available to all those working with the electric chainsaw. This applies also if the sawmill is lent or sold.
- Read the manual and safety instructions for the sawmill.
- Minors under the age of 18 are not allowed to use the electric chainsaw.
- Children and animals must not be near the sawmill during operation.
- Respect the safety distance due to loud noise and the risk of the chain being thrown out in the direction the bar is pointing in the event of a chain break.
- Anyone working with the electric chainsaw should be in good physical shape, healthy and well-rested. Have regular work breaks. Do not work under the influence of alcohol, drugs or medicines that may cause drowsiness or inattentiveness.
- Work with the electric chainsaw should always be carried out under good visibility. Do not work in the dark and neither with reduced vision.
- Make sure there are other people within earshot in case you need help.
- Use only LOGOSOL manufactured products or those expressly approved for the purpose when adding extra equipment. Other equipment may result in risk of accident and must not be used. LOGOSOL disclaims any liability for personal or property damage incurred during the operation of the sawmill with an unauthorised addition.
- If saw units heavier than 15 kg are used, the support legs must be fitted under the ends of the guide rails. Tipping hazard!
- Always wear personal protective equipment: Appropriate clothing is a tight-fitting work overall. Never work with loose clothing, jacket or similar.
- Wear steel cap shoes and deep tread sole for good grip. Do not wear a scarf, tie, jewellery or the like that can catch in the equipment.
- Never reach over or under the guide rail during operation. Rotating cutting equipment. Risk of cuts!
- Wear heavy duty protective gloves. Risk of cuts when handling the bar and saw chain. The cutting equipment can also be hot immediately after sawing.

### Key to symbols

For your own safety, read through the entire user manual carefully and do not start the machine before you have understood everything.

Use approved ear protectors and protective eyewear. Hearing can be damaged even after short periods of exposure.

Sharp rotating tools. Make sure that your fingers never come near the cutting tools.

This symbol means 'WARNING'. Pay particular attention where this symbol appears in the manual text.

This symbol is followed by instructions that must be observed. Pay particular attention where this symbol appears in the manual text.

# SAFETY INSTRUCTIONS

## Safety distances

-  Respect the safety distances. The safety distance is 8 m for the operator and 15 m for persons other than the operator. The illustration below shows the sawmill from above. The operator is to remain within the area marked with a dashed line (---) when the saw is in operation. The operator is not to stretch over the guide rail when the sawmill is in operation.

-  **Increased throw-out risk! Never use a chain sharpened for rip sawing when cross cutting.**

## Before each work period

- Check the lifting line's condition in particular. Change immediately if any sign of wear is detected. Check that bolted joints and locks in the log bed lift and lock system are fully tightened and that all the moving parts of the sawmill move freely and smoothly.
- Check that the sawmill is completely level and that it is securely fixed to the underlying surface.
- Check that the cutting equipment is correctly assembled. Risk of chain breaks!
- Check that saw unit is pushed fully into position on the guide rail. Throw-out risk on start up!

## During operation

-  The sawmill is not to be in any other position than level when in operation. **Risk of overturning!** The sawmill should be fastened directly to the underlying surface or to a bedding of planks (see manual) which increases the area of the load-bearing surface.
- Hold the crank firmly whenever raising or lowering a log. If released, the crank may spin back and hit your hand hard.
-  **Do not place your hand on the inside of the long leg when raising or lowering the log. There is a risk that your hand can be trapped if the lifting line snaps or the crank spins.**
- Do not saw short logs that extend less than 0.2 m beyond each log bed. A shorter log can fall off when the log beds are raised!
  - The maximum permitted load for the sawmill is 1200 kg.
-  **Always stand to the right of the saw unit when it is in operation. Chains that break can be thrown out through the sawdust outlet.**
- Håll arbetsplatsen fri från verktyg, trästycken, spån och andra saker som du kan falla över.
-  **Turn the saw unit off after each cut. Never leave the electric saw unattended such that unauthorized persons can start it.**

-  **If any kind of malfunction occurs, stop sawing immediately and turn off the saw unit until the problem has been resolved. Always keep this in mind. Most accidents with dangerous machines, both the electric saw and other machines, happen when something goes wrong and the operator attempts to fix it while the machine is still running. A stop seldom shows up on the finished product.**

## MACHINE DESCRIPTION

- The Logosol Electric Chainsaw is a chain saw intended for use on Logosol's sawmills Solosågen, Farmer's Sawmill and F2 and F2+.
- The sliding elements that fit on the sawmill beam are integrated in the construction. The saw is powered by an electric motor that transmits the power to the chain via a belt transmission.
- The electric chainsaw is equipped with a mechanical pump, which supplies the bar with chainsaw oil.
- The low friction plastic sliders last for several years thanks to the smooth surface of the aluminium components.

### Maintenance

Check the operation of the machine according to the following instructions to ensure good function:

#### **Check the following before each job:**

Check the condition of the bar and saw chain  
Check level of the chainsaw oil  
Clean the saw

#### **Every 10 hours of operation:**

Check sliding strips/guides for wear  
Check the plastic gear in the oil pump.  
Clean the oil system (from bottle to bar) with e.g. compressed air.

#### **Every 20 hours of operation:**

Check the bearing in the oil pump.  
Check the round belt that drives the oil pump.  
Clean the water cooling (from bottle to bar with e.g. compressed air.  
Check the condition of the belt transmission.

# SAWMILL COMPONENTS

- 1 Base assembly
- 2 Motor assembly
- 3 Motor plate
- 4 Oil pump axle assembly
- 5 Chain guard assembly
- 7 Belt pulley
- 8 Stop screw SK65S M8x10
- 9 Belt pulley
- 10 Poly V belt
- 11 Tapered hex socket screw M6x16
- 12 Flange Nut M6MF M8
- 13 Hex socket screw M8x55
- 14 Hex socket screw MC6S M8x20
- 15 Bottom plate
- 16 Sliding element (saw carriage)
- 17 Spring washer Din137Bd 15x8
- 18 Hex socket screw Mk6S M8x35

# TECHNICAL DATA

**EFFECT**

Rated power ES5 ELECTRIC CHAINSAW 4.6 kW  
 Rated power ES8 ELECTRIC CHAINSAW 8 kW

**TRANSMISSION**

Multi-V belt (10 PJ 610) Max. belt tension: 290 N, Percent elongation: 0.29  
 Chain speed 18.5 m/s

**NOISE LEVELS**

Unloaded sound pressure 97.0 dB(A)  
 Loaded sound pressure 102.0 dB(A)  
 Sound power level 113.0 dB(A)

**DIMENSIONS**

Height 410 mm  
 Length 425 mm  
 Width 410 mm  
 Weight 38/42 kg

**ELECTRICAL SYSTEM**

Power supply 50 Hz 400 V 16 A  
 Enclosure rating IP 54  
 Electrical connection CEE system (round plug) 16A, with inverter

## COMPONENT PARTS: ON DELIVERY

Manual

**1 x Electric saw package  
0000-000-0000**

## FEATURES

### BELT TENSION

Normally, a multi-V belt will last for many years of use but after a time of service, it may need to be tightened so as not to slip when sawing. In order for the belt to last as long as possible, it should be tightened so tight that it just grips but no more.

**Do it like this:** Tilt the saw and loosen the motor securing screws, release as little as possible to free the motor. Then adjust the belt tension using the adjusting screw on the end of the machine. Tighten the motor securing screws thoroughly after completing the adjustment.

### ADJUST THE SLIDING STRIPS

Adjust the saw carriage for perfect fit on the guide rail. Lubricate the guide rail and sliders regularly with silicone spray. Press together the sliders to adjust the play to the guide rail in the vertical plane.

## FEATURES

### MOUNT THE GUIDE BAR

Make sure the power supply is cut. Loosen the nuts holding the bar and lift off the bar plate. Place the bar and chain in place and replace the cover plate. Check that the bar is resting against the spacers and that it is not jammed on wood chips or the chain tensioner. Also check that the chain is turned the right way round and that it lies firmly against the whole sprocket.

Pull the chain around by hand before starting the machine to make sure it is correctly located.

### CHAIN TENSION

Make sure the power supply is cut. Lightly loosen the nuts holding the bar, which are in pairs. The chain is tensioned by screwing the adjusting screw on the side of the machine. Do not tension the chain too tight. It should be easy to pull the entire drive link out of the bar with the thumb and forefinger. If the chain is tensioned too hard it will result in increased wear on both the chain and the bar. Retighten the nuts on the bar once the tension is correct.

## ELECTRICAL SYSTEM

The motor has thermal overheating protection. When the temperature in the motor winding becomes too high, the engine will stop and cannot be started again until it has cooled down.

The chain should run against the saw unit on the cutting side of the bar (anticlockwise). If, on delivery or after a cable change, the motor rotates in the wrong direction, the direction of rotation can be switched by changing the inverter in the saw's electrical contact (the two pins on a white plastic disc). Use a large flat screwdriver.

To avoid voltage drop, it is important to always use as short a power supply cable as possible. The cable area must be at least 2.5 mm<sup>2</sup>, 4 mm<sup>2</sup> should be used for cable lengths over 50 m. If the voltage is too low, the power of the motor will be reduced, and the electrical equipment may be damaged.

To start the saw. Hold down the dead man's grip (2) and press the green button (1) at the same time. You can release the dead man's grip or press the emergency stop (1) to stop the saw.

- 1 Green= on, Red = Emergency Stop
- 2 Constant pressure push button
- 3 Electrical connector with inverter

# TROUBLESHOOTING

## Causes of incorrect measurements when sawing with the Logosol Electric Saw

- A. The sawmill is incorrectly adjusted or set-up.**
- B. The cutting equipment does not work as it should.**
- C. Tensions in the wood.**

### A. Checking the sawmill

- 1.** Check that each of the four legs of the sawmill stands firmly and that the feet do not sink into the ground when the sawmill is loaded with a heavy log.
- 2.** Check the levelness of the log beds to make sure that the sawmill is not skewed. Check both when the sawmill is loaded and unloaded.
- 3.** Using a set square, check very carefully that the guide rail is at an exact 90° angle to the long legs. even a small deviation can lead to incorrect timber measurements.
- 4.** Set the distance between the guide bar and the log beds so that it is exactly the same at both log beds. Make sure that the guide bar and the log beds are fully parallel.
- 5.** Check that the guide rail is absolutely straight by sighting along it, or by running a line over the guide rail and using nails or the like as spacers between the line and the guide rail.

If support legs are used for the guide rail, it is essential that they stand on a rigid surface such as a pole driven into the ground.

Even factory-new guide bars can be out of true. This is detected if the parallel relation to the log bed changes when the guide bar is turned over. A bent guide bar is most easily straightened by being pressed up or down while the saw is mounted on the sawmill.

- 6.** Check that the guide bar is straight in relation to the sawing direction by placing a straight 1.5 m long strip of wood on the guide bar (without the chain). Then sight across the wood strip. It must be parallel with the guide rail. If the wood strip is angled more than 5 mm forwards or backwards, it can have a negative effect on sawing. An out of true guide bar

is corrected by placing washers between the carriage plate and the slide rail. Non-parallel guide bars most often occur when chainsaws other than Stihl are used.

- 7.** The sawmill settings can be checked by placing a broad board of maximum length on the log beds for edging. First saw away a 1/4" wood strip from one side of the board. Then turn the board, set both log beds to the same height and saw off a 1/4" strip. Now measure the width of the board carefully. If the board is not the same width along its entire length, it means that the log beds are incorrectly set or that the guide rail is crooked.

### B. Checking the cutting equipment

The guide bar must not cut upwards or downwards during sawing. If the cutting equipment is faulty, it is most noticeable when the guide bar leaves the log. If the guide bar does not 'float' out of the log but springs up or down, problems can arise. This can be an indication that there is something wrong with the guide bar or the chain.

#### Reasons for malfunction in the cutting equipment:

- 1.** A common cause of sawing problems is that blunt chains are used.
- 2.** The chain may be damaged on one side, for instance by metal objects in the log. The chain may still cut, but pulls up or down.
- 3.** The chain may have been filed incorrectly. The teeth on one side may have been filed less than the ones on the other side. To get a more even result, try to maintain the same working position when filing the left and the right sides of the chain. A few teeth that are damaged or that are missing, e.g. by sawing through nails, usually have very small effect on the function of the chain.
- 4.** When precision diminishes after a period of problem-free sawing, it is almost always due to wear on the guide bar.
- 5.** If you get a ridged surface, consult The Handbook for Your Cutting Tools. It can be downloaded free of charge from our web site.

## When the guide bar is not fitted straight

On some chainsaws the bar fitting is not level, making the bar tilt sideways. Clean the bar fitting. Place a straight and approx. 1 m long board across the guide bar (without the chain) and check against the guide rail. If the guide bar is tilted sideways, place shims between the carriage plate and the slide rails until the board above the guide bar is parallel to the guide rail. Tensions in the wood can sometimes result in similar symptoms as faults in the cutting equipment.

## C. Tensions in the timber

The sawmill can only saw straight. If the wood twists during sawing, then precision will be lost. Tension can cause large variations in measurement. Hardwood often has higher tensions than softwood. But tensions in softwood can also be problematic. Trees that have grown on steep inclines, for instance, can have high tensions. In such cases, a whole group of logs can be difficult to saw.

Tensions can also arise in storage. If the bark and top segment begin to dry, the whole surface will begin to shrink. In such a case, the log may bend slightly, when one side is sawn.

It is easy to discover tension in the wood that leads to measurement errors. Each time you pull the saw back, you can read what is happening in the log. As long as the guide bar continues to lie just above the newly sawn surface, the log has not bent. However, when there is space between the guide bar and the sawn surface, or if the guide bar is pressed upwards when the saw unit is pulled back, it is time to plan how the next cut should be made to reduce the effects of tensions.

When sawing from the top towards the bottom of the cant, the cant has a tendency to bend downwards at its ends. This is especially true if there is large root-end growth. Due to this, it is usually best to turn the log over after passing through the centre, and saw the rest of the material from the other side.

If you still want to saw logs with high tensions, it can be a better alternative to use a chain saw and a Timberjig (SKU: 4900-000-1000) to slice up the log. The Timberjig follows the previously sawn surface and therefore gives better precision if the log bends.

## Some tips for avoiding the effects of wood tensions

1. Cut wood with tensions in as short lengths as possible. By reducing the log length to app. 2.5 m, the precision will be high even if there are high tensions in the wood.
2. Work around the log, sawing all sides in order.
3. To get perfect measurements on the last board, you can use a newly sawn cant as underlay when making the last cut. Another way is to use special accessories for the sawmill to support the ends of the cant. If many logs that are over 3.5 m long are to be sawn, it is best to extend the sawmill by 1 or 2 m and add one extra log lifter/log bed.

# TROUBLESHOOTING

PROBLEM/SYMPTOM	PROBABLE CAUSE	REMEDY
Saws slowly	<ul style="list-style-type: none"> <li>• Dull saw chain</li> <li>• Wrongly set sliders/guides</li> <li>• Resin and dirt on guide rail</li> </ul>	<ul style="list-style-type: none"> <li>• Resharpener or replace the saw chain.</li> <li>• Adjust the guides as instructed.</li> <li>• Clean the guide rail and use silicone spray (art.nr. 9999-000-5110) to reduce friction between the saw and the rail.</li> </ul>

Washboard pattern on saw cut	<ul style="list-style-type: none"> <li>• Incorrectly sharpened saw chain</li> <li>• Sawmill is unstable</li> <li>• Worn bar</li> </ul>	<ul style="list-style-type: none"> <li>• Resharpener the saw chain.</li> <li>• Check that the sawmill is firmly anchored with support under both rail ends.</li> <li>• Renew bar</li> </ul>

## CUTTING EQUIPMENT

LOGOSOL's ripping chain allows quick length sawing with a thin kerf. But it is less durable than normal chains. If you keep the cutting equipment in good condition, you get the right timber dimensions, faster sawing and the cutting equipment will last longer.

### **Sharpen the chain before it gets dull**

When the chain is beginning to get dull, you will notice that the cutting speed is decreasing, the guide bar becomes hot and it becomes harder to feed the saw unit forward. Stop sawing immediately! Actually, when this happens, it is already too late to sharpen the chain. Sawing with a dull chain exposes the cutting equipment to high levels of mechanical stress. Therefore, sharpen the chain before it becomes dull!

### **Avoid chain breaks**

If you are sawing too long with a dull chain, it can break. The chain breaks under the cutting teeth, and you will see that it is worn there.

If, however, a drive link breaks, this can be due to the chain and sprocket not being a good match. The best solution is to run 5 chains alternately on one chain drive. When the chains are worn out, then replace the entire set. A completely new chain on a worn sprocket can break in the first few minutes of use.

It is not recommended to run a normal 1.6 mm cross-cutting chain and 1.3 mm ripping chain on the same sprocket.

### **The guide bar can pull askew**

If the chain has been damaged on one side or been filed unevenly, it can run incorrectly. The guide bar is pressed upwards or downwards and "springs back" when it comes out of the log. The chain will then wear more on one bar rail, and if you continue to saw the guide bar will wear unevenly. Even though you replace the chain, an unevenly worn bar can guide the chain incorrectly and, in addition, the new chain can also be worn down. An unevenly worn bar can be repaired. File bar rails so they are equally high e.g. with an edge file (SKU: 9999-000-0450) or LOGOSOL's electric guide bar grinder (SKU: 7804-000-0005).

Another more common reason for the guide bar pulling askew is that it is worn out so that the drive links touches the bottom in the track of the

### **The best chain oil**

In order for the chain oil to work well it must be viscous and thready. When you place a drop between the thumb and the index finger and then open them, long threads should form. We recommend LOGOSOL's sawmill chain oil, SKU numbers as given below:

1 litre, SKU: 0718-000-1001  
10 litres, SKU: 0718-000-1010

### **Handbook for your cutting tools**

LOGOSOL has a separate document which we keep updated with respect to the technical specification of the latest new products. It is called 'The Handbook for Your Cutting Tools' and can be downloaded free of charge from our web site. You can also order a printed version.

## SAWING: TIPS AND ADVICE

At the start, it can be a good idea to draw lines on the log ends showing what you are planning to cut out from the log. Use a broad tip marker pen to make the line correspond with the kerf.

### Keep in mind that:

- when an unsawn surface of the log faces down, the log bed where the top end of the log rests is to be set higher than the one where the root end rests.
- The beds are set to the same height when a sawn surface faces down.
- Compensate for the kerf (1 click equals 1/4") when the board is cut above the guide bar.
- Do not compensate for the kerf when the board is cut under the guide bar.
- The last board must not be thinner than 2".
- Make sure that you do not cut into the log clamps.

### Through-and-through sawing

Sometimes, it can be better to slice up the log into waney-edged boards. This way you can get a little more out of every log. However, this method takes a bit more time. When cutting fine joinery timber, it can be a good idea to edge only one side before drying the timber. The last edging is not made until you know what the board is to be used for. This is to be able to make use of as much as possible of the timber.

When you are going to slice up a log, it is best if you first cut off a thin slab and then turn that side down to make the log rest on a flat surface on at least one of the log beds. This prevents the log from moving

between the cuts and you will have nice and even boards.

Rotate the log when you have come close to the centre of the log. Calculate at what height you should start sawing.

Remember to compensate with 1/4" for every cut.

### Quarter sawing

Quarter sawing provides you with the finest timber. You get optimum grain direction in every board, which is a big advantage when the wood is intended for cabinetmaking e.g. The downside is that it takes time, it is difficult, and you get several different board widths. Quarter sawing should not be applied when cutting small logs.

Start by cutting the log in half at its centre. Then you cut through the middle of the halves to get quarters.

When cutting the boards, you turn the cant after each cut. Sometimes, it can be easier to cut from below. This way the height of the log beds can be left unchanged.

### Does this seem difficult?

We are many here at LOGOSOL that have long experience in sawing. If you, as a new sawmill owner, have any question, you are warmly welcome to call us. We are happy to provide you with useful tips and advice.

## PRECISION

### **Demands for precision**

We are convinced that a chain sawmill can provide as good results as, or better results than, other small-scale sawing methods. A large number of our customers have reported that they have never had better wood products than those they have sawn themselves. However, it is natural that we also meet customers who want to improve on the precision. Experience has shown us that variations in sawing results can have many explanations. The choice of raw material is vital. Cutting good boards from short, sturdy logs is considerably easier than getting high precision results from long, thin ones. Tensions caused by storage or place of growth can cause problems. Some tree types cause more problems than others, etc.

The precision requirements also vary. A result that is satisfactory for someone sawing boards for rustic fence posts may not be good enough for someone sawing boards to be used in construction without being planed first.

If you have gone through the various steps for adjusting the sawmill, checked the cutting equipment and observed the effects of tensions in the wood, but still do not get the sawing results you expect, please contact us at Logosol.

## DRYING THE WOOD

Once the wood is sawn it must be dried. If this is not done in the right way, then there is a danger it will be damaged by fungal rot.

The best time for outdoor drying is in the spring. The relative humidity of the air is very low and the wood will dry in a couple of weeks.

Cut some supportive blocks in the length that corresponds to the width of your pile, ideally larger pieces, e.g. 5"5, to raise the wood from the ground, which should also be dry, level and free of growth. The spacing should not exceed 1 m and should lie level and in line with each other.

Cut spacers or drying sticks in the same length as the supportive blocks. They should be of the same thickness (1x1" or 1x2") and dry. (You can get material for these by making an extra cut when edging your boards.)

Place the first row of boards on the underlying surface. The boards are to be of the same thickness and be positioned a few centimetres apart. Then place spacers on the boards (in the same positions as the underlying supportive blocks) before the next layer is laid. It is important to place the spacers exactly over each other, to keep the boards from warping or bending.

The higher you pile the boards, the better pressure there is on the lower boards. Place roofing of plastic, metal sheeting or masonite over the top to provide protection from rain, but leave the sides open. Put a weight of some sort on the roof to put pressure on the top boards.

If the wood is to be used for fine joinery, it should be stored in a heated room for another 3-4 weeks (longer for thicker dimensions) or be dried in a wood drying kiln for a perfect result.

It is possible to use undried wood in some constructions, but it must be kept in mind that the width and height will shrink 5%. Wood also shrinks around 0.3% in length, but this can usually be disregarded. In order to avoid rot, you should not enclose undried wood in a way that makes it hard for air to circulate. One further tip: Do not drive two nails next to each other as the board will probably crack in the middle when it dries out. Drive one nail and wait with the second until the wood has dried.

One example of where you should use undried wood is when building log structures. In such a situation, a heavy wall is a plus, as is the possibility that the logs still can be shaped when they are pressed against each other.

*LOGOSOL also has electric wood drying kilns for preparation of fine joinery timber.*

## EU declaration of conformity

In accordance with Directive 2006/42/EG, Annex 2A

Logosol AB  
Fiskaregatan 2  
871 33 Härnösand  
SWEDEN

hereby declares that **Logosol ES5/ES8 electric chainsaw**

is manufactured in accordance with:  
Machinery Directive 2006/42/EG  
EMC Directive 2004/108/EU

and has been manufactured in conformity with the following harmonized standards:  
EN ISO 12100:2010  
EN 60204-1:2006  
EN 50370-1, -2.
